SHREYA BALIGA (NUID:002795178)

PROGRAM STRUCTURES AND ALGORITHM
ASSIGNMENT-2

TASK:

Solve 3-SUM using the Quadrithmic, *Quadratic*, and *quadraticWithCalipers* approaches, as shown in skeleton code in the repository.

Approach:

For Cubic:

Implementation of ThreeSum which follows the brute-force approach of testing every candidate in the solution-space.The array provided in the constructor may be randomly ordered.
* Construct a ThreeSumCubic on a.
  * @param a :an array.

For Quadratic:

Implementation of ThreeSum which follows the approach of dividing the solution-space into
* N sub-spaces where each sub-space corresponds to a fixed value for the middle index of the three values.
* Each sub-space is then solved by expanding the scope of the other two indices outwards from the starting point.
* Since each sub-space can be solved in O(N) time, the overall complexity is O(N^2).
 * Construct a ThreeSumQuadratic on a.
   * @param a :a sorted array.
   * Get a list of Triples such that the middle index is the given value j.
   * @param j :the index of the middle value.
   * @return a Triple

For Quadratic with Calipers:

Implementation of ThreeSum which follows the approach of dividing the solution-space into
 * N sub-spaces where each sub-space corresponds to a fixed value for the middle index of the three values.
 * Each sub-space is then solved by expanding the scope of the other two indices outwards from the starting point.

* Since each sub-space can be solved in O(N) time, the overall complexity is O(N^2).
The array provided in the constructor MUST be ordered.
   * Construct a ThreeSumQuadratic on a.
   * @param a: a sorted array.

* Get a list of Triples such that the middle index is the given value i.
   * @param a : a sorted array of ints.
   * @param i : the index of the first element of resulting triples.
   * @param function : a function which takes a triple and returns the comparison of sum of the triple with zero.
   * @return a Triple

Relationship Conclusion: It can be observed from the results of the benchmark test:
In the worst case scenario which happens when we generate all possible triplets and compare the sum of every triplet with the given value and therefore, runs in cubic time: O(n^3).

In the average and best case scenario which follows the approach of dividing the solution-space into N sub-spaces where each sub-space corresponds to a fixed value for the middle index of the three values. Each sub-space is then solved by expanding the scope of the other two indices outwards from the starting point. The array provided must be sorted.Since each sub-space can be solved in O(N) time, the overall complexity is O(N^2).

EVIDENCE:

I have attached a table and chart to show the relationship between raw time and value of n.

Value of n	No. of runs	Cubic Raw Time(ms)	Cubic Normalized Time(n^3)
250	100	14.06	0.9
500	50	140.7	1.13
1000	20	1424	1.42
2000	10	9401.5	1.18
4000	5	57412.6	0.9
8000	3	NA	NA
16000	2	NA	NA

Value of n	No. of runs	Quadrithmic Raw Time(ms)	Quadrithmic Normalized Time(n^2logn)
250	100	1.46	4.45
500	50	6.82	3.04
1000	20	29.35	2.95
2000	10	131.8	1.11
4000	5	584.2	3.05
8000	3	3608.67	4.35
16000	2	16686	4.67

Value of n	No. of runs	Quadratic Raw Time(ms)	Quadratic Normalized Time(n^2)
250	100	1.17	18.72
500	50	1.68	6.72
1000	20	6.2	6.2
2000	10	44.2	11.05
4000	5	283	17.69
8000	3	1223	19.11
16000	2	6137.5	23.97

ThreeSum

Cubic, Quadrithmic & Quadratic Raw Time

× Cubic Raw Time(ms)   × Quadrithmic Raw Time (ms)   × Quadratic Raw Time (ms)

Passed Unit Test Cases:

```
210    final static LazyLogger logger = new LazyLogger(Timer.class);
211
212    static class TimerException extends RuntimeException {
213        public TimerException() {
214        }
215
216        public TimerException(String message) {
217            super(message);
218        }
219
220        public TimerException(String message, Throwable cause) {
221            super(message, cause);
222        }
223
224        public TimerException(Throwable cause) {
225            super(cause);
226        }
227    }
228 }
229
```
